Fixture Corpus

1 Retrieval

Dense retrieval maps each passage to a single vector.

The vector index returns nearest neighbours by cosine distance.

Lexical retrieval matches rare terms that embeddings often miss.

Reciprocal rank fusion merges two lists without score scaling.

A cross encoder reranks the fused candidates in a second pass.

Fixture Corpus

2 Calibration

The refusal threshold is fitted on held out query passage pairs.

A calibrated probability below the threshold triggers a refusal.

Every citation must quote a verbatim span from its passage.

A claim whose quote is absent is dropped before it is displayed.

Each page is hashed so an extractor upgrade fails loudly.

Fixture Corpus

3 Citations

This fixture corpus exists to exercise the citation interface.

Hybrid retrieval finds the rare term “quokka” but vector only misses it.

The lexical ranker uses ts_rank_cd rather than BM25.

Reranking can move a passage from rank nine to rank one.

The final context contains at most eight passages.

Fixture Corpus

4 Rendering

The highlight layer rebuilds the page string before it searches.

Whitespace is collapsed and typographic quotes are normalised.

On a miss, the interface draws the stored rectangles instead.

The citation render miss counter is reported with every answer.

An answer with no resolvable citation is never shown to the reader.
